

Abstract of the Disclosure

5 A guardrail (10) has posts (12) and railing (16)
offset from the post with blocks (14). The post has a
plurality of wood layers. The wood layers are joined
together with an adhesive. The adhesive is made with
first and second components mixed together just prior to
application. One the wood layers may be made with
shorter sections joined together lengthwise to form a
10 portion of the wood layer. The shorter sections are
joined together with a finger joint. A first wood layer
(20) has greater strength than a second wood layer (26)
and the second wood layer is more pliable than the first
wood layer. A man-made material such as plastic can be
15 disposed between the wood layers.
